Definition and Description

Nicotine Pouches are a unique category in the tobacco alternative market. Essentially, they are small, pre-portioned bags containing nicotine, flavorings, and other ingredients, designed for oral use. Unlike traditional tobacco products, these pouches do not contain tobacco leaf; instead, they rely on a synthetic or derived source of nicotine.

These pouches are used by placing them between the gum and the upper lip, where the nicotine is absorbed through the mucous membranes in the mouth. This method of consumption is smokeless, does not require chewing, and is discreet, making nicotine pouches a popular choice among those looking for an alternative to smoking or chewing tobacco.

The terminologies used for nicotine pouches vary, with some common names including "nicotine pouches," "nicotine sachets," and "non-tobacco snus." Despite the different names, the core concept remains the same: a tobacco-free, smokeless nicotine delivery system.

Understanding what nicotine pouches are and how they are referred to across different markets is crucial for consumers and health advocates alike. This clarity aids in distinguishing them from traditional tobacco products and highlights their position as a tobacco-free alternative.
